SecureBG Wireless Connection

These steps will help you connect using SecureBG wireless network. While this guide shows screen shots from Windows, these steps will work on most platforms. For more information on connection or for additional help please contact the Technology Support Center.

View available wireless networks and connect to “bgsu” unsecure wireless network and open a web browser.

This screen is from Windows, but the network should be unsecure and available for all operating systems.

At the login screen, Select the link for “New WPA2 Secure Wireless Click Here” to have Cloudpath configure your system.
Accept the terms of license and select **start**.

You will be prompted to install the “XpressConnect” software from Cloudpath Networks. Walk through this install.

A loading bar will appear on your screen for a few seconds and then you will be brought to this page. Enter your BGSU Username and Password.

Give the software a few seconds to finish the install.
If credentials are accepted, you will obtain a new IP address and have access to the network. Select **Done**.

If you have questions regarding the WPA2 setup please contact the Technology Support Center.
SecureBG Wireless Connection

Much like passwords, system certificates are occasionally required to be updated and (or) changed. When this happens SecureBG will require the end user to verify the system certificate to allow a trust relationship to be built between the devices ensuring secure encrypted communications over the wireless network. Your wireless device should notify you about the certificate change, but you might be required to go into your system settings to see this notification. You will need to confirm the new certificate to continue using SecureBG.

Here is what the notice looks like on the most common devices:

**iOS (iPod, iPad, iPhone)**

This is what you will see in iOS on your iPad, iPhone or iPod. Selecting Accept will close the window and allow you to keep working.

**Apple OS 10**

This pop up will be displayed on any Mac Computer running 10.5 through 10.8.

Selecting continue will bring up the following confirmation and then be returned to working order.

**Android OS**

No update is required for Android, as no certificate was needed to install SecureBG on an Android account.
SecureBG Wireless Connection

Window’s 7

This window will be displayed on your PC. Select “Connect” to install the new certificate and sign in anyway. You can show or hide details about the update by selecting the arrow in the bottom left hand corner.

It is also important to note that this message will appear on a standard install of Windows. Some software packages or updates may change what you see slightly.

Window’s XP

This window will be displayed on your PC. Select “OK” to install the new certificate and sign in anyway. You can show more information about the certificate by selecting “View Server Certificate”

It is also important to note that this message will appear on a standard install of Windows. Some software packages or updates may change what you see slightly.
