Foster children come from many different backgrounds and experiences. Using pooled (2016-2018) Current Population Survey (CPS) data, this profile examines how foster children compare to biological, adopted, and stepchildren. Statistics reported here represent minor children identified as a foster child to the head of household. The CPS estimate is lower than that provided by the Adoption and Foster Care Analysis and Reporting System (AFCARS), which considers foster children through age 20. Further, AFCARS designates children placed in foster care with a relative who are likely identified as a relative to the household head in the CPS rather than a foster child. The CPS data allow for detailed poverty estimates that include foster children (e.g. supplemental poverty)—which is not available in any other dataset—providing unique insight into a vulnerable population in the U.S.

Trend of Foster Children in the U.S.

- The number of foster children has risen since 1988. From 1988 to 1998, there was a 46% increase in the number of foster children, representing the largest increase in the last three decades.

Age of Foster Children

Children in foster care were often younger than those who were not in foster care; in 2016-2018, 47% of foster children were 6 or younger compared to only 37% of other children.

- About one-quarter of foster children were teenagers (13-27) in contrast to 29% of biological, adopted, or stepchildren.
Race/Ethnicity of Foster Children, 2016-2018

Foster children were more racially and ethnically diverse compared with biological, adopted, and stepchildren in the U.S.

- Over one-quarter (28%) of foster children were Hispanic, and almost one-fifth (17%) of foster children were Black.
- The majority of biological, adopted, and stepchildren were White (56%). The majority of foster children were either Black, Hispanic, or multiracial.

Poverty Status of Foster Children, 2016-2018

About 18% of foster children lived in poverty compared with 15% of other children.
