“Cognitive impairment, multimorbidity, and end-of-life care in older cancer patients”

Using data from the newly linked Surveillance, Epidemiology and End Results (SEER), Medicare, and nursing home Minimum Data Set (MDS), we characterize NH cancer patients by gradients of cognitive impairment and complex multimorbidity by patient age, sex, cancer incident status, cancer type, and prognosis, and particularly by race/ethnicity to (1) analyze patterns of unstaged cancer, cancer-directed care, and aggressive EOL care and (2) the associated costs.

“Older Adults with Dementia: Common Combinations and Impact of Co-occurring Chronic Illnesses”

Using *Health and Retirement Study* data linked to Medicare Claims, we identified and compared the most common combinations of chronic conditions, functional limitations, and geriatric syndromes across older adults with no cognitive impairment (CI), and each of mild, moderate and severe CI, and identified the leading causes of death associated with each of the identified clusters. In addition, the occurrence of ambulatory care sensitive hospitalizations across the CI spectrum is examined.
