

### **What if I want a dummy variable for each value?**

Perhaps you have a series of dummy variables you need to create. For example, perhaps you want to transform a variable called "NUMMAR" which has five values ranging from 0 to 4 indicating the number of times a person has been married into several dummy variables.

```
tab nummar, gen(mardum)
```

This creates 5 variables dummy variables for the number of times married.
